Comments

HETG is inserted as a filter; there is very little useful gratings information in the observation. The zeroth order position used in the grating extraction is NOT at the position of the pulsar, but is near a bright emission knot to the NE, on the outer ring circumscribing the pulsar. The dispersed spectrum only contains data for the meg +1 order between 1-2 A. The pulsar is near the edge of the read portion of the detector. Broad east/west streak in Level 2 data is instrumental, due to the fact that the spacecraft dither during this observation was only 1 arcsec. Aim point located 30 arcsec east of the pulsar, as requested by the observer.
