# A Summary

## A.1 Status

V&V Scientist	Joy Nichols
V&V Date (YYYY-MM-DD)	2006.07.19
V&V Edition	1
V&V Disposition and Status	OK
V&V Charge Time	97.721

## A.2 Comments

Focal plane temperature is warmer than -118.7 degrees C during first approximately 3 ksec of the observation.

The ACIS spectral response calibration for the front-illuminated chips is less accurate at these warmer temperatures than it is at -119.7 C. The back-illuminated chips are unaffected at this temperature. Users whose science objectives depend on the most accurate spectral response (ie: fitting line-rich spectra) may notice an effect if they use data from a front-illuminated chip. Users whose science objectives do not depend on the most accurate spectral response should not notice an effect.

The original processing of this obsid used the telemetered data from the recorder that had a bias map with a data gap. That bias file was replaced in the original processing with bias file constructed by scaling a similar bias file from another observation to fill the data gap. For this processing, realtime data from the satellite was used to fill data gaps from the recorder. All bias maps are complete in this version of the processing and there was no need to construct a replacement bias.
