

- **tcloutr: tclout with return value**

Syntax: **tcoutr** <option> [<par1>] [<par2>] [<par3>]>

tcloutr is identical to the **tclout** command except that it also provides what is stored in `$xspecc_tclout` as a return value. Therefore it can be used in tcl scripts like this:

```
set var1 [tcloutr energies 1]
```

tcloutr may produce quite a lot of unwanted screen output, which can be avoided by using **tclout**.
